

JPL Applications of Two-Phase Thermal Control Technology for Future Spacecraft

Gaj Birur

Jet Propulsion Laboratory California Institute of Technology, Pasadena, California

June 7-8, 2001

Presented at

International Two-Phase Thermal Control Technology Workshop

The Aerospace Corporation, El Segundo, California

JPL Future Space Science Missions at JPL

Mars missions

- Landers, rovers, in-situ production experiments, and robotic support for human colonization
- MER (2003), Mars Orbiter (2005), Mars Mega Lander (2007), Mars μmission

Missions to comets/asteroids

- Comet Nucleus Sample Return Mission
- Asteroid exploration and sample return

· Missions to other planets

- Europa orbiter/lander (2005), Pluto/Kuiper Express (2008)
- Saturn Ring Observer, Neptune Orbiter

· Other missions

- Earth orbiting spacecraft/science payload
- Space telescopes, instruments

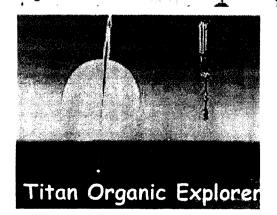

Future NASA Deep Space Missions

Advanced technologies needed in many diverse systems: Orbiters, landers, probes, rovers, penetrators, aerobots, aircraft, sub-surface, submarine, ...?

Small Body In-Situ Exploration and Sample Return

JPL Applications of Two-Phase Technology

- Fixed conductance heat pipes used on Wide-Field Planetary Camera (Hubble Telescope) in 1985
- Mars Pathfinder examined two-phase devices in 1993-94 but chose mechanically pumped liquid cooling loop
- EOS -TES has five LHPs (propylene) (2002 launch)
- Cloudsat is using seven VCHP (2003 launch)
- Mars Exploration Rover is using a mini LHP (2003 launch)
- Advanced technology mini LHPs investigated for Mars and deep space applications - variable conductance LHP and dual evaporator LHP
- MEMS based pumped liquid loop for micro/nano spacecraft

JPL Two-Phase Thermal Technology Roadmap

L Loop Heat Pipes on EOS TES Instrument

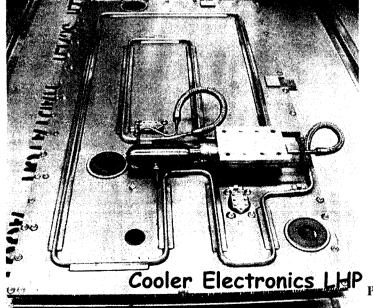

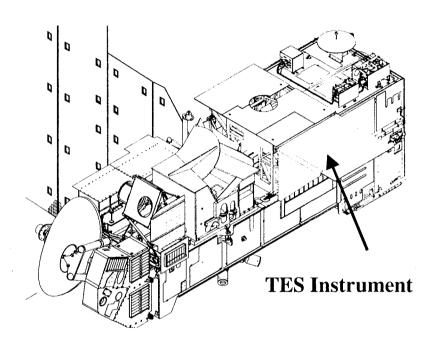

- Five LHPs are used on EOS-TES for thermal control (Jose Rodriguez, Thermal Lead)
- Heat transfer rate of 32 to 100 Watts
- Start up heater of 10 Watts and shut-off CC heater of 1.5
 Watts used on all LHPs
- Propylene is used as working fluid to prevent freezing during periods when radiator temperature drops below -80 C
- LHPs used primarily as heat switch to prevent electronics temperature going below low limit

Loop Heat Pipes on EOS TES Instrument

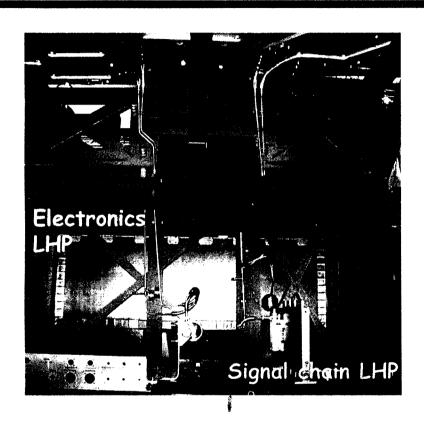

Adv-tech\Papers\Two-Phase-2001\JPL_appi~.ppt May 7, 2001; Gaj Birur

JPL Loop Heat Pipes on EOS TES Instrument

VCHP on Cloudsat Instrument

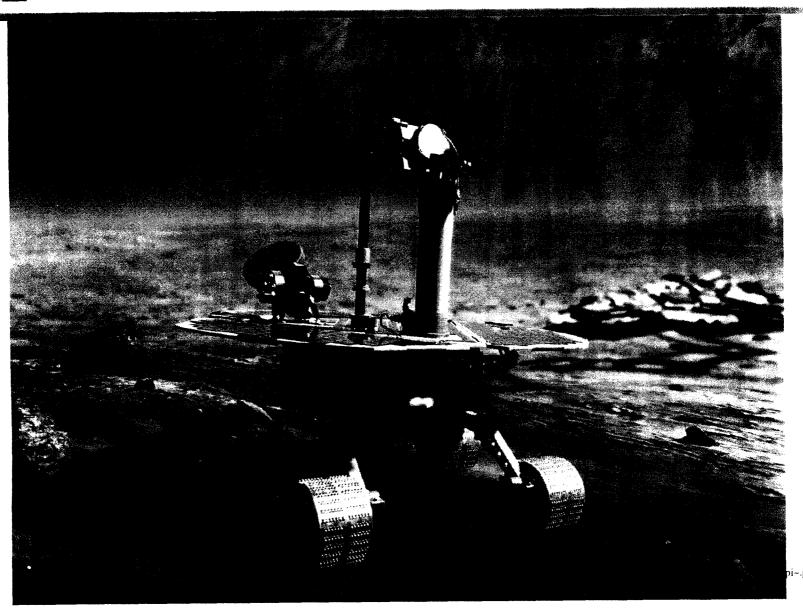

- Cloudsat uses seven VCHPs for thermal control (Ray Becker, Thermal Lead)
- Because of large surface area of heat source VCHPs were preferred over LHP
- VCHPs are about one meter long and have a heat transfer rate of 30 to 85 Watts
- · Ammonia is used as the working fluid
- VCHPs used primarily as heat switch to prevent electronics temperature going below low limit

JPL

Mars Exploration Rover Conceptual View

MER Rover Miniature Loop Heat Pipe

Description

- Mini loop heat pipe with 0.5 inch nickel wick and ammonia as working fluid
- Light weight (less than 150 gms (with out the radiator to transfer 50 W)
- Vapor and liquid lines are 1/16 inch dia provides enormous flexibility in locating heat sources and sinks on the spacecraft

MER Rover WEB Radiator Page No

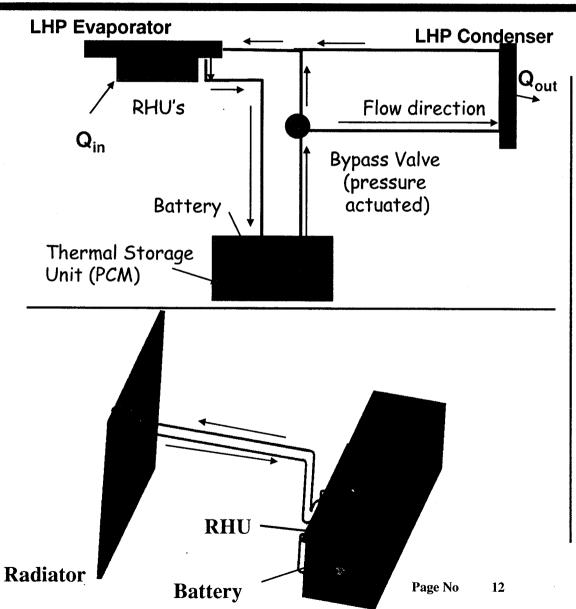

Application

- This LHP removes heat from the MER rover SSPA during the day on Mars, start up heater and CC heater used for control
- Light weight and flexibility allows for easy mechanical integration in the rover
- Small dia tubing allows the condenser to freeze and thaw during Martian diurnal cycles
 Adv-tech\Papers\Two-Phase-2001\PL_appi~.ppt May 7, 2001; Gaj Birur

Variable Conductance Loop Heat Pipe

Application

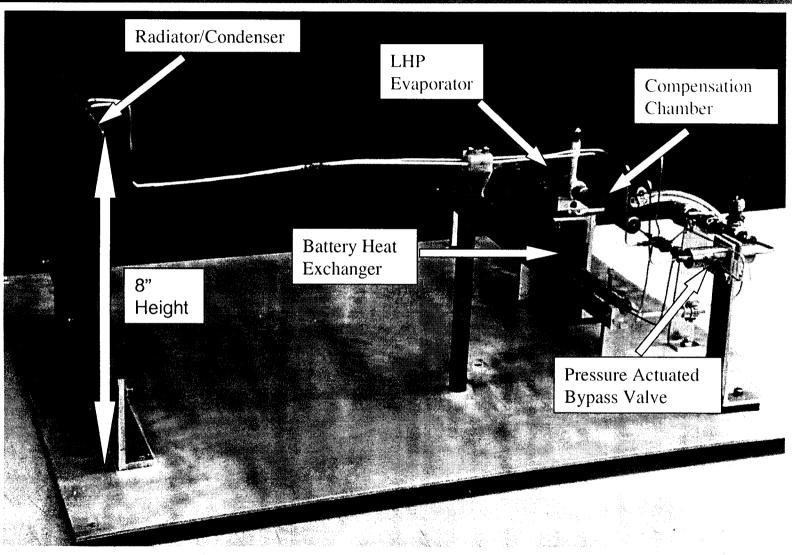

- VCLHP evaluated for Mars battery thermal control
- Backpressure actuated valve is used to bypass the radiator
- Small dia (1/16") tubing allows the condenser to freeze and thaw during Martian diurnal cycles
- Performance and condenser freeze/thaw tests (100 cycles) conducted during late 2000

IPLPhase Change Thermal Storage Technology

Description:

- Phase change material (PCM) utilizes latent heat to protect batteries against low temp.
 extremes by providing thermal storage
- PCM stores excess heat when available and releases the heat when needed
- The technology is simple, reliable, and mass efficient

Current Status:

- Dodecane PCM material (-10 C MP) encapsulated in a carbon fiber matrix
- A battery/PCM capsule was fabricated by ESLI for JPL
- It is integrated with miniature LHP and being tested at JPL in a simulated Martian environment to evaluate rover battery/electronics thermal control

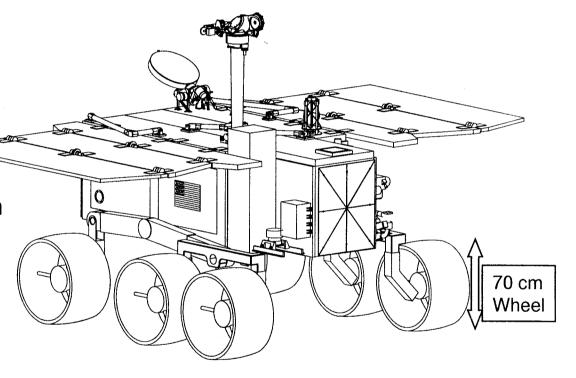

Future Development:

- Investigate PCM materials with lower MP for lower temperature operations (below -20 C)
- Develop and qualify low mass system for thermal energy management on Mars landers, in-situ experiments and Microspacecraft missions

Thermal Control for Future Mars Rovers

- Mass = 200 750 kg
- Solar Array Area = 7.0 m²
- Wheel diameter = 70 cm
- Max Power = 100 to 175 W
- Secondary Battery
- Design Life = 90 -180 days
- Telecom links to orbiter & Earth
- Payload: cameras, spectrometers, instrum. arm, drill, sample cache & Mars Ascent Vehicle
- Thermal Control:
 - CO2 gas gap insulation
 - up to 30 RHU's
 - Radiators & LHPs or Pumped Fluid Loop

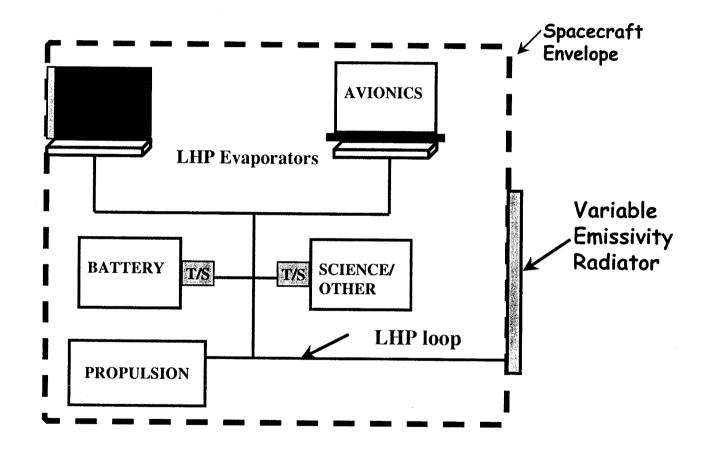

Adv-tech\Papers\Two-Phase-2001\JPL_appi~.ppt May 7, 2001; Gaj Birur

Advanced Thermal Architecture

Based on Passive Cooling Loop

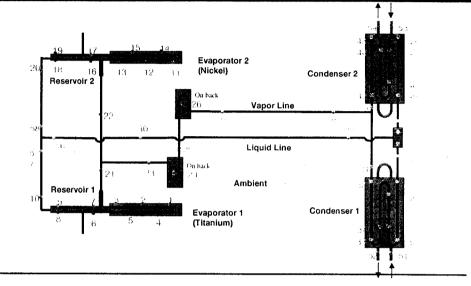

Dual Miniature Evaporator Mini LHP

Participants & Facilities

- JPL is investigating this technology for space applications (Mars rover & microspacecraft)
- Tests performed at GSFC during FY00 and more tests at JPL in 2001 for its applications for passive thermal control architecture
- Dynatherm Corporation fabricated the dual evaporator (Ni and Ti wicks) miniature loop heat pipe

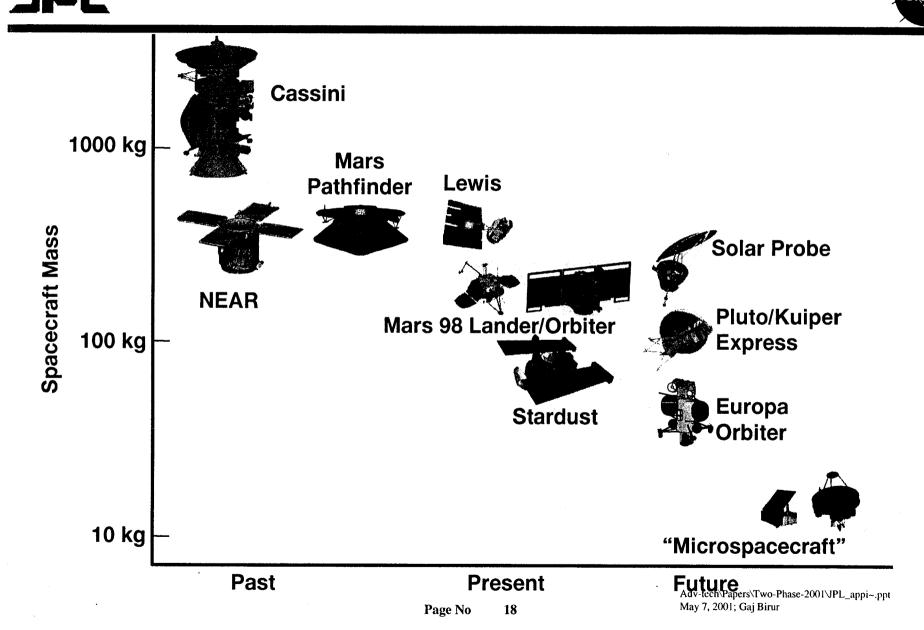

Mission Impact & Future Applications

- This technology reduces S/C thermal control mass and provides enormous flexibility
- This is a key technology for enabling Integrated Thermal Energy Management System
- This technology is applicable to small & large S/C and planetary vehicles thermal control

Conclusions

- Two-phase technology is an important thermal control element of JPL's future space science missions
- Two-phase technologies are being investigated as both enabling and enhancing technologies
- These technologies span both near/far term missions and large/micro spacecraft
- JPL is conducting technology development in collaboration with other organizations
